

Web Lab-01: Apache Web Server Installation & Maintenance

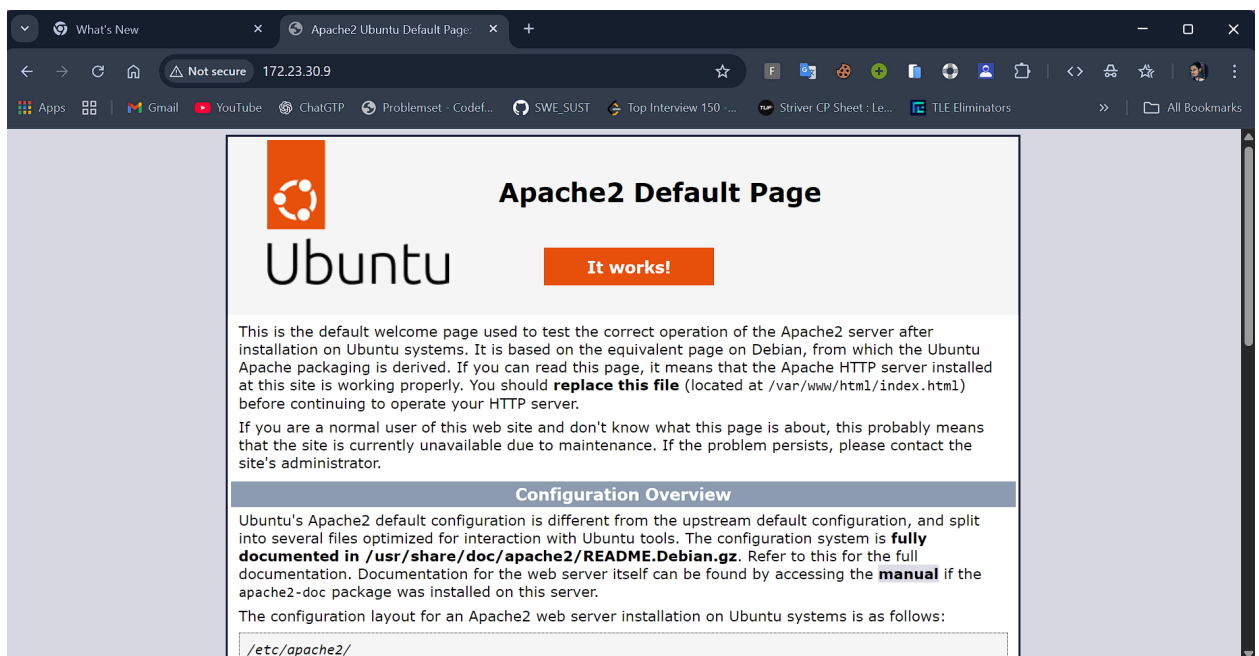

Student Name: Md Robiul Islam Robin

Student ID: 2020831043

Checkpoint 1: Installed Apache Successfully

Commands:

```
sudo apt update
sudo apt install apache2 -y
sudo service apache2 start      # Start Apache
sudo service apache2 status     # Check Apache status
```

To access it from Windows browser, visit:

<http://172.23.30.9>

Checkpoint 2: Configured Virtual Hosts for Multiple Domains

Step 1: Create directories for each domain

```
sudo mkdir -p /var/www/example.com/public_html
sudo mkdir -p /var/www/webserverlab.com/public_html
```

Step 2: Set permissions

```
sudo chown -R $USER:$USER /var/www/example.com/public_html
sudo chown -R $USER:$USER /var/www/webserverlab.com/public_html
```

Step 3: Create index.html files

```
echo "<h1>Welcome to Example.com</h1>" >
/var/www/example.com/public_html/index.html
echo "<h1>Welcome to WebserverLab.com</h1>" >
/var/www/webserverlab.com/public_html/index.html
```

Step 4: Create virtual host files

```
sudo nano /etc/apache2/sites-available/example.com.conf
```

Add:

```
<VirtualHost *:80>
    ServerAdmin admin@example.com
    ServerName example.com
    ServerAlias www.example.com
    DocumentRoot /var/www/example.com/public_html
    ErrorLog ${APACHE_LOG_DIR}/error.log
    CustomLog ${APACHE_LOG_DIR}/access.log combined
</VirtualHost>
```

Similarly, for webserverlab.com:

```
sudo nano /etc/apache2/sites-available/webserverlab.com.conf
```

Add:

```
<VirtualHost *:80>
```

```
ServerAdmin admin@webserverlab.com
ServerName webserverlab.com
ServerAlias www.webserverlab.com
DocumentRoot /var/www/webserverlab.com/public_html
ErrorLog ${APACHE_LOG_DIR}/error.log
CustomLog ${APACHE_LOG_DIR}/access.log combined
</VirtualHost>
```

Step 5: Enable virtual hosts

```
sudo a2ensite example.com.conf
sudo a2ensite webserverlab.com.conf
sudo a2dissite 000-default.conf # disable default site if desired
sudo service apache2 reload
```

Step 6: Update Windows hosts file to test domains

- Open `C:\Windows\System32\drivers\etc\hosts` as administrator.
- Add:

```
127.0.0.1 example.com
127.0.0.1 webserverlab.com
```

- Now you can access the domains from Windows browser:

```
http://example.com
http://webserverlab.com
```

Checkpoint 3: Observed Behavior with Enabled/Disabled Sites

- **Observation:** After enabling only `example.com` and disabling default site, both `http://webserverlab.com` and `http://127.0.0.1` showed `example.com` content.

- **Reason:** Apache uses the first enabled virtual host as a fallback for unmatched requests.

Checkpoint 4: Setting Up Multiple Virtual Hosts

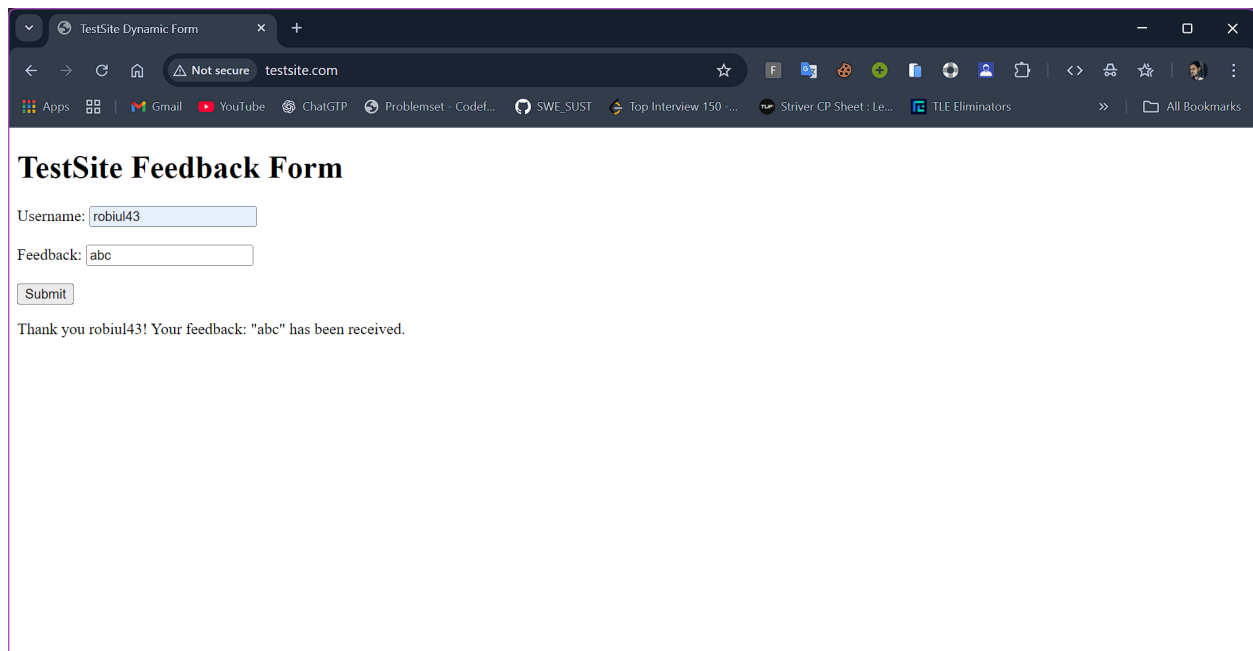

- Configured multiple virtual hosts (example.com, webserverlab.com).
- Verified configuration:

```
apache2ctl configtest  
sudo service apache2 restart
```

- Browsers show the correct content per domain.

Checkpoint 5: Created Two Dynamic Websites

Example Form (testsite.com)

The screenshot shows a web browser window with the address bar displaying "testsite.com". The page title is "TestSite Dynamic Form". The main content area contains a form titled "TestSite Feedback Form". The form has two input fields: "Username:" with the value "robiul43" and "Feedback:" with the value "abc". Below these fields is a "Submit" button. After clicking the button, a message appears: "Thank you robiul43! Your feedback: 'abc' has been received." The browser's address bar shows "Not secure" and the page is loaded from "testsite.com". The browser's bookmark bar shows several links including "Apps", "Gmail", "YouTube", "ChatGPT", "Problems - Codef...", "SWE_SUST", "Top Interview 150...", "Striver CP Sheet : Le...", and "TLE Eliminators".

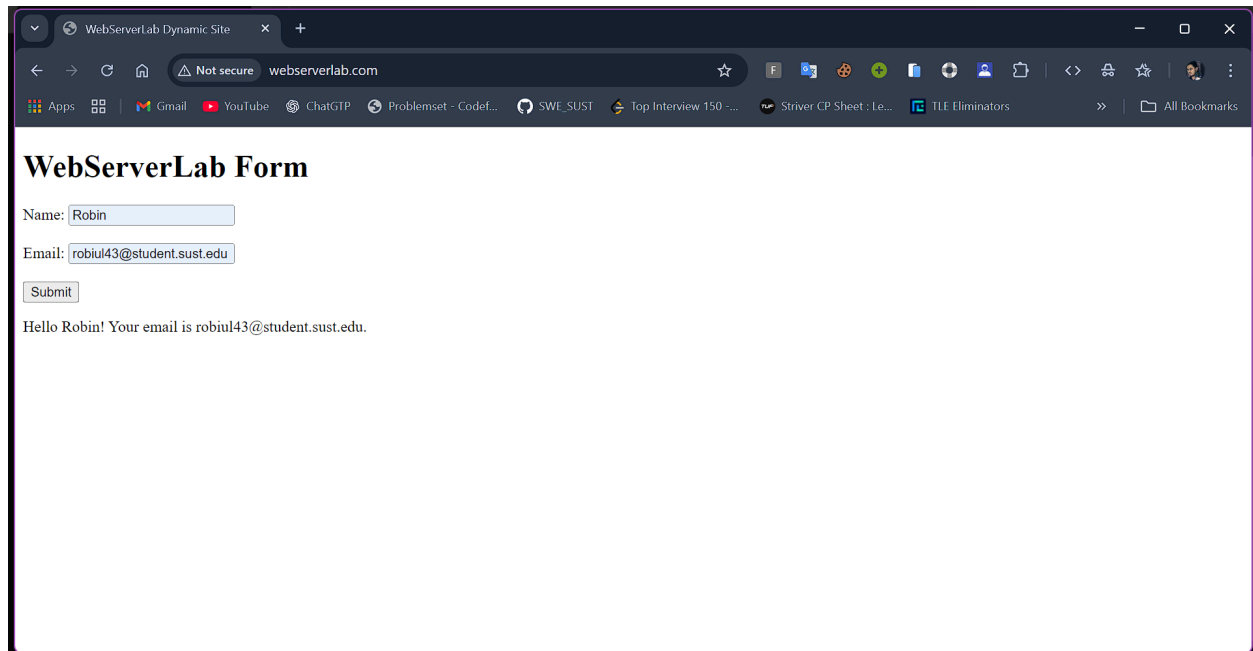

TestSite Feedback Form

Username:

Feedback:

Thank you robiul43! Your feedback: "abc" has been received.

Example Form (webserverlab.com)

The screenshot shows a web browser window with the address bar displaying 'webserverlab.com'. The page title is 'WebServerLab Dynamic Site'. The form itself is titled 'WebServerLab Form' and contains two input fields: 'Name:' with the value 'Robin' and 'Email:' with the value 'robiul43@student.sust.edu'. Below these fields is a 'Submit' button. After clicking the button, the page displays the message 'Hello Robin! Your email is robiul43@student.sust.edu.'.

Manage Apache Service

In WSL, use:

```
sudo service apache2 stop
sudo service apache2 start
sudo service apache2 restart
```

For persistent start on boot (optional):

```
sudo systemctl enable apache2
```

Add local domain to Windows hosts file

In **Windows**, open:

```
C:\Windows\System32\drivers\etc\hosts
```

•
